DETAILED ACTION***Specification***

The specification has been checked to the extent necessary to determine the presence of all possible minor errors. However, the applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

Claim Rejections***Claim Rejections - 35 USC § 112***

Claims 1-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Correction or clarification is required.

In claim 1, the recitation "the voltage level" on line 13 lacks clear antecedent basis and the recitation "t1 and t2" on line 13 is confusing because it is unclear if this is additional "t1" and "t2" or further recitation of the previously claimed "t1" on line 11 and "t2" on line 12. Also, it is unclear how the "logic gate", "the first circuit" and "the second circuits" can be "configured" to switch states since they cannot switch by themselves, and how the recitation "first circuit logic gate" on line 4, "first input logic gate" on line 8, "first circuit capacitor", "first circuit" and "second circuit" are read on the preferred embodiment. Insofar as understood, no such circuits, gate and capacitor are not seen on the drawings. The same is true for claims 2, 4-10, 12-13 and 16-19.

In claim 17, the recitation "its resistance" on line 8 lacks clear antecedent basis. It is unclear how the impedance circuit and the latch can be "configured" to change the resistance and states

Art Unit: 2816

The remaining claims are dependent from the above claims and therefore also considered indefinite.

Allowable Subject Matter

Claims 1-20 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, second paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.

The claims are allowed because the prior art of record does not show the first logic gate, a first circuit capacitor and the first circuit are coupled in series, the first and second circuits are configured to switch states at time t1 in response to the switching states at time t2 of the first input logic gate as combined in claims 1 and 9, and the first impedance circuit being coupled in series to the latch, the impedance being configured to change its resistance and the latch switching states at time t1 in response to the input gate switching states at time t2 as combined in claim 17.
